

Archive Accelerator Export For Veritas Enterprise Vault™

One of the greatest challenges companies face is storing and managing unstructured content. Archive Accelerator Export gives companies the ability to conduct fast, highly robust mass exports of data from Veritas Enterprise Vault™ - all managed via a simple management console interface.

At Vault Solutions, we're committed to taking the power of Enterprise Vault one step further with Archive Accelerator Export (AAE). Information can be exported for third-party analysis, taken offline for long-term storage, preserved in a non-proprietary format, or migrated to a separate archive for any number of reasons. AAE is scalable to support export of billions of items, while automated scheduling ensures no impact to productivity

The latest version of Archive Accelerator Export has several new features aimed at significantly improving functionality.

Targeted Export Flexibility with the data that's being exported, especially in larger organizations, is critical. Targeted Export allows for the efficient export of a particular user's email from the journal archives, enabling you to target specific emails by person and date range rather than having to export the entire archive. In addition, large companies with more than one brand under their umbrella, or those that have changed names, can also search and export based on domain.

Although flexibility is a welcomed improvement, another crowd pleaser is speed. We optimized AAE's performance by increasing speed with a new 64 bit architecture. Whether exporting .MSG or .PST files, Archive Accelerator Export exports more gigabytes per hour than either Enterprise Vault or Discovery Accelerator.

Key Features:

Supports Migration to Cloud Services

Increase efficiency by scripting to automate exports

Multi-Threaded for optimal performance

Runs in background as a Windows service

Can be schedule for increased productivity

Output to PST, MSG or EML format

Chain of custody

Erred item retry capability

Targeted Export Enhanced speed with 64-bit architecture

Even more filtering capabilities
