Legal Hold Manager
For Veritas Enterprise Vault™

Vault Solutions Archive Accelerator Legal Hold Manager provides valuable insights and a holistic view of all legal hold cases across the business with an easy-to-use visual dashboard.

How it works
Archive Accelerator Legal Hold Manager uses Veritas Discovery Accelerator (DA) to place holds on data stored in Enterprise Vault archives. With this streamlined integration, cases created with Legal Hold Manager can also be managed through DA.
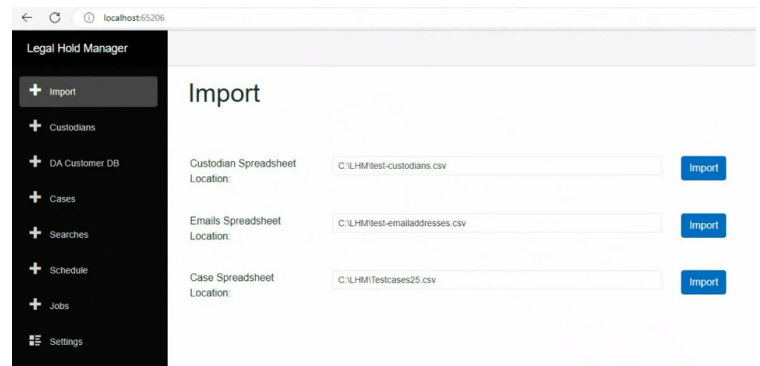

Legal Hold Manager provides an API for integration with third party legal hold software, or a customer's own internal automation. This maximizes efficiency and allows for continued use of existing applications and processes.

Cases
Legal Hold Manager's modern web interface provides a global view of the status of all your cases, making them easier to manage across multiple Discovery Accelerator databases.

Evergreen Hold
Legal Hold Manager supports scheduled searches for custodians on evergreen hold. We create recurring searches to pick up any new messages that were created since the hold was put on hold in the first place. This ensures any new data will be captured and given the appropriate hold.

Data can be imported based on 3 different criteria: Custodian, emails, or cases.

Key Features:

Automate creation of thousands of cases in Discovery Accelerator (DA)

Support for multiple DA customer databases

Central view of DA cases across all DA servers and databases

Dramatically reduces manpower required to place thousands of custodians on legal hold

Uses throttling to avoid taxing the Enterprise Vault and DA environment

Provides an API for third-party integration to enable seamless automation
